

Revision

Ch 1.3 – Introduction to Java.

Q1. Who developed Java, where and when was it developed?

Ans: James A. Gosling and his colleagues developed Java in 1991 at Sun Microsystems.

Q2. Write any 4 features of Java.

Ans: Following are the features of Java:

- It is an Object Oriented Programming language.
- It is case-sensitive.
- Java programs are both compiled and interpreted.
- Java is a robust language.

Q3. What are the two different platforms for writing Java programs?

Ans: The two different platforms for writing Java programs:

- Java Application or Standalone Application
- Java Applets or Internet Applets.

Q4. Define Byte Code.

Ans: The Java compiler converts source code to an intermediate binary code, that helps in generating the machine code and is independent of the machine on which the program runs, is known as Byte Code.

Q5. What is JVM?

Ans: Java Virtual Machine (JVM) is a software-based engine that runs Java programs. It converts the byte code into machine specific object code.

Q6. Why the following packages are used- java.util, java.lang, java.applet, java.awt?

Ans:

- java.util – To perform input-output tasks with precise statements dealing in various data types.
- java.lang – To support classes containing String/Character, Math, Integer, Thread, etc. This is the default package.
- java.applet – To support classes to generate applet-specific environment.
- java.awt – To support abstract window toolkit and managing GUI, required for applet programming.

Q7. Give 2 examples, where Java is used to develop the applications.

Ans:

- Mobile applications – Netflix, Twitter
- Desktop GUI Applications – ThinkFree, Adobe Acrobat Reader
- Web Based Applications – Banking Systems, Amazon
- Cloud-based Applications – Google Docs, Dropbox
